Matrix class

(provided by Matrices.h and .cpp)

```
//calculating rotation matrix
float sinX = sin(rotationX);  #include <cmath>
float cosX = cos(rotationX);

Matrix4 Rx = Matrix4(1, 0, 0, 0, 0, 0, 0, cosX, -1*sinX, 0, 0, sinX, cosX, 0, 0, 0, 0, 0, 1);
```

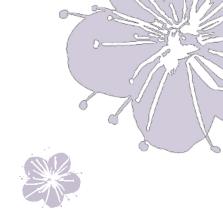

```
Matrix initialization
```

Matrix4 R = Rz*Ry*Rx

Vector class (provided by Matrices.h and .cpp)

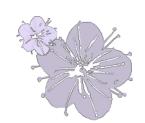

initialization

Vector3 eyePos(eyeX, eyeY, eyeZ);

forwardVector = eyeLookAt - eyePos;

operation

MVP matrix

P: projection matrix

V: viewing matrix

→ Vr: viewing rotation, Vt: viewingtranslation

M: model matrix

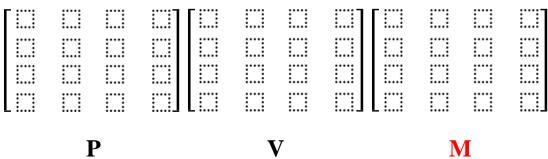

T: model translation, S: model rotation,

R: model rotation, N: Normalization

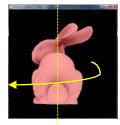

Geometrical Transformation

- Manipulate 3D models
 - Translation, scaling, rotation

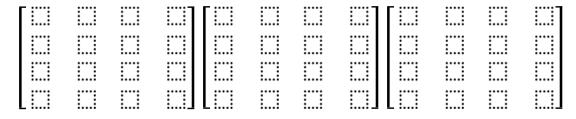

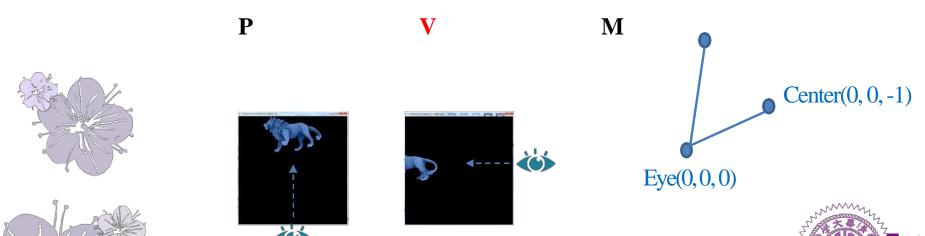

Normalize the model with transformation matrix!

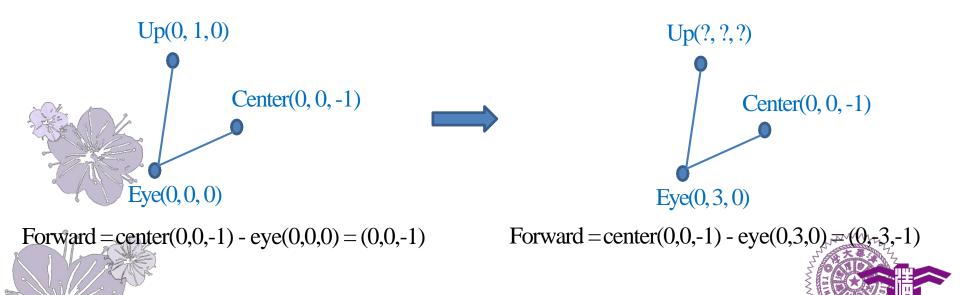

Viewing Transformation

- Display 3D models from different view.
 - Eye position, center position, up position

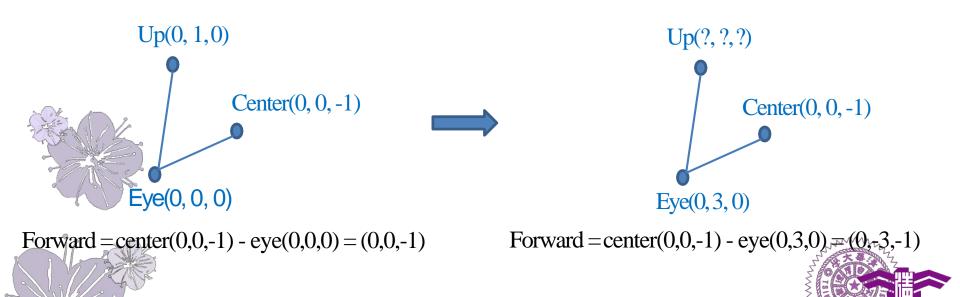

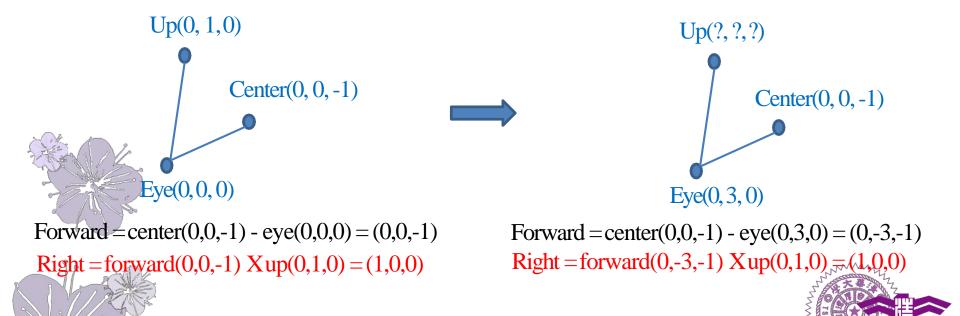

• When change eye(center) position, we have to adjust up position to get a proper result, here is an example, if we move eye from (0,0,0) to (0,3,0)

 Because the forward vector and up vector must be perpendicular, now forward vector changed, we need to compute new upvector

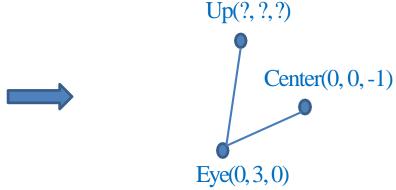

• In this case, we can compute right vector by the cross product of forward and up vector(old one)

• Finally re-compute new up vector by the cross product of right vector and forward vector, and find new up position!

Forward = center(0,0,-1) - eye(0,0,0) = (0,0,-1) Right = forward(0,0,-1) X up(0,1,0) = (1,0,0) Up = right(1,0,0) X forward(0,0,-1) = (0,1,0)

```
Forward = center(0,0,-1) - eye(0,3,0) = (0,-3,-1)
Right = forward(0,-3,-1) Xup(0,1,0) = (1,0,0)
```

```
Up vector(new) =

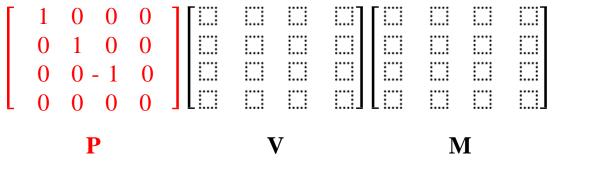

right(1,0,0) X forward(0,-3,-1) = (0,1,-3)

Up(position) =

eye(0,3,0) + up vector(0,1,-3) = (0,1,-3)
```

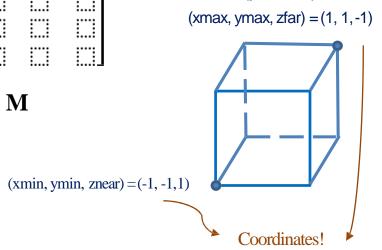

Projection Transformation

- Project 3D models on screen in different way.
 - Parallel(orthogonal), perspective projection

Reference

Transformation p.81-p.95

Default value in HW1

(parallel)

Projection Transformation

- Project 3D models on screen in different way.
 - Parallel(orthogonal), perspective
